# Part 3

## Lecture 3 Recap on Confounding

# Who I am...

Pascal Tyrrell, PhD

*Associate Professor*

Department of Medical Imaging, Faculty of Medicine

Institute of Medical Science, Faculty of Medicine

Department of Statistical Sciences, Faculty of Arts and Science

# BIAS AND CONFOUNDING

The factory workers of Art Smith are concerned about having severe Shortness of Breath (SOB). 100 employees exposed and a 100 not exposed were selected from the workforce. The following table summarizes the results for the SOB variable.

## EXPOSURE AND PERCENTAGE OF SOB

	DISEASE		Total	%SOB	
	YES	NO			
TOXIN	YES	38	62	100	38%
	NO	15	85	100	15%

**Fisher's p=0.0004**

**Odds Ratio = 3.48    95% CI    1.76 - 6.87**

**Relative Risk = 2.53    95% CI    1.49 - 4.30**

# REVIEW OF RELATIVE RISK AND ODDS RATIO

## EXPOSURE AND PERCENTAGE OF SOB

	DISEASE		Total %SOB			
	YES	NO				
TOXIN	YES	38	62	100	38%	Fisher's p=0.0004
	NO	15	85	100	15%	

$$\text{RELATIVE RISK} = P1/P0 = 0.38 / 0.15 = 2.53$$

$$\begin{aligned} \text{ODDS RATIO} &= (P1/Q1) / (P0/Q0) \\ &= (0.38/0.62) / (0.15/0.85) \\ &= 0.613 / 0.176 = 3.48 \end{aligned}$$

His friend John Smith was surprised because his workers are exposed to the same chemical and have reported no increase in SOB. He then remembered that most of his employees are women. This observation led Art to look at the results for his female employees.

**EXPOSURE AND SOB PERCENT IN FEMALES**

	DISEASE		Total	%SOB	
	YES	NO			
TOXIN	2	18	20	10.00%	
	7	73	80	8.75%	Fisher's p=1.0

Odds Ratio = 1.16      95% CI 0.22 - 6.06  
 Relative Risk= 1.14      95% CI 0.26 - 5.01

Art now assumed the excess risk must be among his male workers and was surprised that his males workers experienced no increased risk.(  $p = 0.86$ ).

## EXPOSURE AND % SOB DISEASE IN MALES

	DISEASE		Total	%SOB	
	YES	NO			
TOXIN	YES	36	44	80	45
	NO	8	12	20	40
					Fisher's $p=0.86$
Relative Risk=1.13			95% CI	0.62	- 2.03
Odds Ratio =1.23			95% CI	0.45	- 3.33

**PERCENTAGE OF SOB  
BY TOXIN EXPOSURE AND SEX**

	<b>FEMALES</b>	<b>MALES</b>	<b>OVERALL</b>
<b>YES</b>	$2/20 = 10.00\%$	$36/80 = 45.00\%$	$38/100$
<b>NO</b>	$7/80 = 8.75\%$	$8/20 = 40.00\%$	$15/100$
<b>RR</b>	1.14	1.13	2.53
<b>Fisher's p</b>	1.00	0.86	0.0004

# LANGUAGE OF CONFOUNDING

- Males are at a higher risk of disease
- Higher proportion of males exposed to toxin
- The increased risk of SOB in the group of exposed workers is not due to the toxin but because it has a greater percentage of males who have a higher percentage of SOB.

Perhaps males are given dirtier jobs or choose not to wear protective clothing. The SEX variable is called a CONFOUNDER.

# Famous discussion between Charles Darwin and his cousin Francis Galton

Charles Darwin

1809 - 1882

Francis Galton

1822 - 1911

Darwin, concerned about the small sample size of his experiment, wrote:

*“As only a moderate number of crossed and self-fertilized were measured, it was of great importance to me to learn how far the averages were trustworthy. I therefore asked Mr. Galton, who has much experience in statistical researches to examine some of my tables of measurement .....*”

The typical survey in the social sciences in the 19<sup>th</sup> century was very large. Darwin, a biologist, understood that a difference between two means of only 15 subjects selected from two different countries would unlikely result in any sound conclusions because of the wide variability among the observations.

However, Darwin believed the small sample size of his experiment was compensated by the care that he took in the design and execution of his study:

*“But the case is somewhat different with my crossed and self-fertilized plants, as they were of exactly the same age, were subjected from the first to last to the same conditions and were descended from the same parents.”*

# CREATING WIDE DATASET FOR PAIRED DATA
